“A Brief History of the Bootstrap and Resampling Methods”

Dr. Matthew N. Chasse
Lecturer in Department of Mathematics,
Rochester Institute of Technology
Rochester, New York

Abstract

We take a look at the historical development of resampling techniques, their mathematical justifications, and their strengths and weaknesses. The presentation will be at an advanced undergraduate level with a focus on examples. We mainly discuss the estimation of variance using different resampling algorithms, and proceed to discuss permutation tests with any remaining time.
